(54) **Lowering serum cholesterol using a HMG CoA reductase inhibitor and a squalene synthetase inhibitor**

(57) A pharmaceutical combination is provided which includes an inhibitor of the enzyme 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, such as lovastatin, pravastatin or velostatin, and an inhibitor of the enzyme squalene synthetase. A method for reducing serum cholesterol or inhibiting formation of or treating atherosclerosis using the above combination is also provided.

GB 2 227 662 A

HMG CoA REDUCTASE INHIBITORAND METHOD FOR LOWERING SERUM
CHOLESTEROL

5

The present invention relates to a combination of an inhibitor of 3-hydroxy-3-methyl-glutaryl coenzyme A (HMG CoA) reductase and an
10 inhibitor of squalene synthetase and to a method for lowering serum cholesterol and/or preventing or treating atherosclerosis by administering such combination.

15

There are several different classes of compounds which have serum cholesterol lowering properties. Some of these compounds are inhibitors of the enzyme HMG CoA reductase which is essential
20 in the production of cholesterol, such as mevastatin (disclosed in U. S. Patent No. 3,983,140), lovastatin also referred to as mevinolin (disclosed in U. S. Patent No. 4,231,938), pravastatin (disclosed in U. S. Patent
25 No. 4,346,227) and velostatin also referred to as synvinolin (disclosed in U. S. Patents Nos. 4,448,784 and 4,450,171).

Other compounds which lower serum cholesterol may do so by an entirely different mechanism than the HMG CoA reductase inhibitors. For example, serum cholesterol may be lowered
5 through the use of bile acid sequestrants such as cholestyramine, colestipol, DEAE-Sephadex and poly(diallylmethylamine) derivatives (such as disclosed in U. S. Patents Nos. 4,759,923 and 4,027,009) or through the use of antihyperlipo-
10 proteinemics such as probucol and gemfibrozil which apparently lower serum "low density lipoproteins" (LDL) and/or converts LDL into high density lipoproteins (HDL).

U. S. Patent No. 4,759,923 mentioned above
15 discloses that poly(diallylmethylamine) derivatives which are bile salt sequestrants may be used in conjunction with drugs which reduce serum cholesterol by mechanisms other than sequestration, such as clofibrate, nicotinic acid, probucol,
20 neomycin, p-aminosalicylic acid or mevinolin (also referred to as lovastatin).

Squalene synthetase is a microsomal enzyme which catalyzes the reductive dimerization of two molecules of farnesyl pyrophosphate (FPP) in the
25 presence of nicotinamide adenine dinucleotide phosphate (reduced form) (NADPH) to form squalene (Poulter, C. D.; Rilling, H. C., in "Biosynthesis of Isoprenoid Compounds", Vol. I, Chapter 8, pp. 413-441, J. Wiley and Sons, 1981 and references
30 therein). This enzyme is the first committed step of the de novo cholesterol biosynthetic pathway. The selective inhibition of this step should allow the essential pathways to isopentenyl tRNA,

ubiquinone, and dolichol to proceed unimpeded. Squalene synthetase, along with HMG-CoA reductase has been shown to be down-regulated by receptor mediated LDL uptake (Faust, J. R.; Goldstein, J. L.; Brown, M. S. Proc. Nat. Acad. Sci. USA, 1979, 76, 5018-5022), lending credence to the proposal that inhibiting squalene synthetase will lead to an up-regulation of LDL receptor levels, as has been demonstrated for HMG-CoA reductase, and thus ultimately should be useful for the treatment and prevention of hypercholesterolemia and atherosclerosis.

One approach to inhibitors of squalene synthetase is to design analogs of the substrate FPP. It is clear from the literature that the pyrophosphate moiety is essential for binding to the enzyme. However, such pyrophosphates are unsuitable as components of pharmacological agents due to their chemical and enzymatic lability towards allylic C-O cleavage, as well as their susceptibility to metabolism by phosphatases.

P. Ortiz de Montellano et al in J. Med. Chem., 1977, 20, 243-249 describe the preparation of a series of substituted terpenoid pyrophosphates (Table A), and have shown these to be competitive inhibitors of the squalene synthetase enzyme. These substances retain the unstable allylic pyrophosphate moiety of FPP.

Table A

10	<u>No.</u>	<u>X</u>	<u>Y</u>	<u>Z</u>
	1	CH ₃	CH ₃	H

	4	I	H	H
15	5	H	I	H
	6	CH ₃	H	SCH ₃

Corey and Volante, J. Am. Chem. Soc. 1976, 98, 1291-3, have prepared FPP analog A and presqualene pyrophosphate (PSQ-PP) analog B as inhibitors of squalene biosynthesis. (Presqualene pyrophosphate is an intermediate in the conversion of FPP to squalene). These inhibitors possess methylene groups in place of the allylic oxygen moiety of FPP and PSQ-PP, but still retain the chemically and enzymatically unstable pyrophosphate linkage.

25 Poulter and co-workers have prepared
cyclopropane C (Sandifer, R. M., et al.,
J. Am. Chem. Soc. 1982, 104, 7376-8) which in the
presence of inorganic pyrophosphate is an
intermediate analog inhibitor of the enzyme
squalene synthetase.

Altman and co-workers, Bertolino, A.,
 et al., Biochim. Biophys. Acta. 1978, 530, 17-23,
 15 reported that farnesyl amine and related
 derivatives D inhibit squalene synthetase, but
 provide evidence that this inhibition is
 non-specific and probably related to membrane
 disruption.

10 Poulter, C.D., Stremier, K.E., J.A.C.S.,
 1987, 109, 5542 describes the synthesis and
 biological evaluation of compounds having structure
F. These compounds were evaluated as alternative
 substrates for avian liver farnesyl diphosphate and
 lemon peel cyclase.

15

20

FX=CH₂, CF₂

McClard, R. W. and Poulter, C. D., et al.,
J.A.C.S. 1987, 109, 5544, reported that
 phosphinylphosphonates G and H were competitive
 25 inhibitors of the 1'-4-condensation between
 isopentenyl diphosphate and geranyl diphosphate
 catalyzed by avian liver farnesyl diphosphate
 synthetase. Phosphinylphosphonates G and H had
 Ki's of 19μM and 71μM, respectively. They also
 30 reported the speculative isolation of the farnesyl
 phosphinylphosphonate I, and the geranyl
 phosphinylphosphonate J from the enzymatic reaction
 of G with geranyl pyrophosphate or dimethylallyl

pyrophosphate, respectively. The structures of I and J were tentatively assigned based on relative TLC mobilities. They hypothesized that I could be a potential inhibitor of squalene synthetase.

15

In accordance with the present invention, a pharmaceutical combination is provided for use in reducing serum cholesterol and in inhibiting formation of, or treating atherosclerosis, which combination is formed of an inhibitor of the enzyme 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase and an inhibitor of the enzyme squalene synthetase.

25 The HMG CoA reductase inhibitor will be employed in a weight ratio to the squalene synthetase inhibitor of within the range of from about 0.001:1 to about 1000:1 and preferably from about 0.05:1 to about 100:1.

30 In addition, in accordance with the present invention, a method is provided for lowering serum cholesterol or inhibiting formation of or treating atherosclerosis wherein a therapeutically effective amount of the above combination is systemically, such as orally or parenterally, administered over a
35 prolonged period.

The combination of the HMG CoA reductase inhibitor and squalene synthetase inhibitor is a surprising and unique concept in inhibiting or treating elevated cholesterol and/or atherosclerosis in that it may provide additional anti-cholesterolemic effects over that which may be obtained using each of the components of the combination alone. In addition, the combination of the invention which includes compounds with different mechanisms of action, may be used to effectively treat cholesterol-related diseases of multiple etiology.

It has been found that in animal models, the HMG CoA reductase inhibitor initially inhibits cholesterol biosynthesis and also up-regulates LDL (low density lipoprotein) receptors thereby compensating for any net increase in cholesterol biosynthesis which might eventually occur. It is theorized that the squalene synthetase employed in combination with the HMG CoA reductase inhibitor, will provide another block in the cholesterol biosynthesis pathway to reduce cholesterol biosynthesis.

The HMG CoA reductase inhibitors suitable for use herein include, but are not limited to, mevastatin and related compounds as disclosed in U. S. Patent No. 3,983,140, lovastatin (mevinolin) and related compounds as disclosed in U. S. Patent No. 4,231,938, pravastatin and related compounds such as disclosed in U. S. Patent No. 4,346,227, velostatin (synvinolin) and related compounds as disclosed in U. S. Patents Nos. 4,448,784 and 4,450,171, with lovastatin, pravastatin or velostatin being preferred. Other HMG CoA

reductase inhibitors which may be employed herein
 include, but are not limited to, fluindostatin
 (Sandoz XU-62-320), pyrazole analogs of mevalono-
 lactone derivatives as disclosed in U. S. Patent
 5 No. 4,613,610, indene analogs of mevalonolactone
 derivatives as disclosed in PCT application
 WO 86/03488, 6-[2-(substituted-pyrrol-1-yl)alkyl]-
 pyran-2-ones and derivatives thereof as disclosed
 in U. S. Patent No. 4,647,576, Searle's SC-45355 (a
 10 3-substituted pentanedioic acid derivative)
 dichloroacetate, imidazole analogs of mevalono-
 lactone as disclosed in PCT application WO 86/07054,
 3-carboxy-2-hydroxy-propane-phosphonic acid
 derivatives as disclosed in French Patent No.
 15 2,596,393, 2,3-di-substituted pyrrole, furan and
 thiophene derivatives as disclosed in European
 Patent Application No. 0221025, naphthyl analogs of
 mevalonolactone as disclosed in U. S. Patent No.
 4,686,237, octahydro-naphthalenes such as disclosed
 20 in U. S. Patent No. 4,499,289, keto analogs of
 mevinolin (lovastatin) as disclosed in European
 Patent Application No. 0,142,146 A2, as well as
 other known HMG CoA reductase inhibitors.

In addition, compounds useful in inhibiting
 25 HMG CoA reductase suitable for use herein are
 disclosed in U.S. application Serial No. 182,696
 filed April 18, 1988, which compounds have the
 moiety

wherein X is -O- or -NH-, n is 1 or 2 and Z is a hydrophobic anchor.

Examples of such compounds include (S)-4-
 5 [[4'-fluoro-3,3',5-trimethyl[1,1'-biphenyl]-2-yl]-
 methoxy]methoxyphosphinyl]-3-hydroxy-butanoic
 acid, methyl ester or its monolithium salt,

(S)-4-[[[4'-fluoro-3,3',5-trimethyl[1,1'-
 biphenyl]-2-yl]methoxy]hydroxyphosphinyl]-3-
 hydroxybutanoic acid, dilithium salt,

10 (3S)-4-[[[4'-fluoro-3,3',5-trimethyl[1,1'-

 20 methoxy]phenyl]methoxy]methylphosphinyl]-3-
 hydroxybutanoic acid, or its methyl ester, and

(S)-4-[[[4'-fluoro-3,3',5-trimethyl[1,1'-
 biphenyl-2-yl]methyl]amino]methoxyphosphinyl]-3-
 hydroxybutanoic acid, monolithium salt.

25 Another class of HMG CoA reductase inhibitors
 suitable for use herein include compounds disclosed
 in U.S. application Serial No. 182,710, filed April
 18, 1988, which compounds have the moiety

wherein X is $-\text{CH}_2-$, $-\text{CH}_2-\text{CH}_2-$, $-\text{CH}=\text{CH}-$, $-\text{CH}_2\text{CH}_2\text{CH}_2-$, $-\text{C}\equiv\text{C}-$ or $-\text{CH}_2\text{O}-$, where O is linked to Z, and Z is a hydrophobic anchor.

Examples of such compounds include (S)-4-
5 [[[E)-2-[4'-fluoro-3,3',5-trimethyl[1,1'-biphenyl]-
2-yl]ethenyl]hydroxyphosphinyl]-3-hydroxybutanoic
acid or its dilithium salt;

The squalene synthetase inhibitors suitable for use herein include, but are not limited to, those disclosed by Biller et al., supra, including isoprenoid (phosphinylmethyl)phosphonates such as
25 those of the formula

5

I

II

R¹

10

15

20

including the triacids thereof, triesters thereof
and tripotassium and trisodium salts thereof as
25 well as other squalene synthetase inhibitors
disclosed in European Patent Application EP-A-324421
published 19th July 1989.

In addition, other squalene synthetase
inhibitors suitable for use herein include the
30 terpenoid pyrophosphates disclosed by P. Ortiz de
Montellano et al., J. Med. Chem.; 1977, 20,
243-249, the farnesyl diphosphate analog A and
presqualene pyrophosphate (PSQ-PP) analogs as

disclosed by Corey and Volante, J. Am. Chem. Soc. 1976, 98, 1291-1293, phosphinylphosphonates reported by McClard, R. W. et al., J.A.C.S., 1987, 109, 5544 and cyclopropanes reported by Capson, T.L., PhD dissertation, June, 1987, Dept. Med. Chem. U. of Utah, Abstract, Table of Contents, pp. 16, 17, 40-43, 48-51, Summary.

The disclosure of the above-mentioned patents and patent applications are incorporated herein by reference.

Preferred are combinations of lovastatin, pravastatin or velostatin with a squalene synthetase inhibitor such as disclosed by Biller et al., supra.

In carrying out the method of the present invention, the combination of the invention may be administered to mammalian species, such as monkeys, dogs, cats, rats, humans, etc. and as such may be incorporated in a conventional systemic dosage form, such as a tablet, capsule, elixir or injectable. The above dosage forms will also include the necessary carrier material, excipient, lubricant, buffer, antibacterial, bulking agent (such as mannitol), anti-oxidants (ascorbic acid or sodium bisulfite) or the like. Oral dosage forms are preferred, although parenteral forms are quite satisfactory as well.

The dose administered must be carefully adjusted according to age, weight and condition of the patient, as well as the route of administration, dosage form and regimen and the desired result.

Thus, for oral administration, a satisfactory result may be obtained employing the HMG CoA reductase inhibitor in dosages employed, for example, for lovastatin as indicated in the Physician's Desk Reference, such as in an amount within the range of from about 1 to 2000 mg, and preferably from about 4 to about 200 mg in combination with the squalene synthetase inhibitor in dosages in an amount within the range of from about 10 mg to about 2000 mg and preferably from about 25 mg to about 200 mg with the HMG CoA reductase inhibitor and squalene synthetase inhibitor being employed together in the same oral dosage form or in separate oral dosage forms taken at the same time.

A preferred oral dosage form, such as tablets or capsules, will contain the HMG CoA reductase inhibitor in an amount of from about 0.1 to about 100 mg, preferably from about 5 to about 80 mg, and more preferably from about 10 to about 40 mg, and the squalene synthetase inhibitor in an amount of from about 10 to about 500 mg, preferably from about 25 to about 200 mg.

The composition described above may be administered in the dosage forms as described above in single or divided doses of one to four times daily. It may be advisable to start a patient on a low dose combination and work up gradually to a high dose combination.

Tablets of various sizes can be prepared, e.g., of about 2 to 2000 mg in total weight, containing one or both of the active substances in the ranges described above, with the remainder

being a physiologically acceptable carrier of other materials according to accepted pharmaceutical practice. These tablets can, of course, be scored to provide for fractional doses. Gelatin capsules
5 can be similarly formulated.

Liquid formulations can also be prepared by dissolving or suspending one or the combination of active substances in a conventional liquid vehicle acceptable for pharmaceutical administration so as
10 to provide the desired dosage in one to four teaspoonsful.

Such dosage forms can be administered to the patient on a regimen of one to four doses per day.

According to another modification, in order
15 to more finely regulate the dosage schedule, the active substances may be administered separately in individual dosage units at the same time or carefully coordinated times. Since blood levels are built up and maintained by a regulated schedule
20 of administration, the same result is achieved by the simultaneous presence of the two substances. The respective substances can be individually formulated in separate unit dosage forms in a manner similar to that described above.

25 Fixed combinations of HMG CoA reductase inhibitor and squalene synthetase inhibitors are more convenient and are preferred, especially in tablet or capsule form for oral administration.

In formulating the compositions, the active
30 substances, in the amounts described above, are compounded according to accepted pharmaceutical practice with a physiologically acceptable vehicle, carrier, excipient, binder, preservative,

stabilizer, flavor, etc., in the particular type of unit dosage form.

Illustrative of the adjuvants which may be incorporated in tablets are the following: a binder
5 such as gum tragacanth, acacia, corn starch or gelatin; an excipient such as dicalcium phosphate or cellulose; a disintegrating agent such as corn starch, potato starch, alginic acid or the like; a lubricant such as stearic acid or magnesium
10 stearate; a sweetening agent such as sucrose, aspartame, lactose or saccharin; a flavoring agent such as orange, peppermint, oil of wintergreen or cherry. When the dosage unit form is a capsule, it may contain in addition to materials of the above
15 type a liquid carrier such as a fatty oil. Various other materials may be present as coatings or to otherwise modify the physical form of the dosage unit. For instance, tablets or capsules may be coated with shellac, sugar or both. A syrup of
20 elixir may contain the active compound, water, alcohol or the like as the carrier, glycerol as solubilizer, sucrose as sweetening agent, methyl and propyl parabens as preservatives, a dye and a flavoring such as cherry or orange.

25 Some of the active substances described: above form commonly known, pharmaceutically acceptable salts such as alkali metal and other common basic salts or acid addition salts, etc. References to the base substances are therefore
30 intended to include those common salts known to be substantially equivalent to the parent compound.

The formulations as described above will be administered for a prolonged period, that is, for as long as the potential for elevated serum cholesterol and atherosclerosis remains or the symptoms continue. Sustained release forms of such formulations which may provide such amounts biweekly, weekly, monthly and the like may also be employed. A dosing period of at least one to two weeks are required to achieve minimal benefit.

The following Examples represent preferred embodiments of the present invention. All temperatures are expressed in degrees Centigrade unless otherwise indicated and all mesh sizes are U.S. Standard ASTME.

Example 1

A pravastatin formulation in the form of tablets having the following composition was prepared as described below.

	<u>Ingredient</u>	<u>Parts by Weight</u>
	Pravastatin	7
	Lactose	67
15	Microcrystalline cellulose	20
	Croscarmellose sodium	2
	Magnesium stearate	1
	Magnesium oxide	3

Pravastatin, magnesium oxide and a fraction (30%) of the lactose were mixed together for 2 to 10 minutes employing a suitable mixer. The resulting mixture was passed through a #12 to #40 mesh size screen. Microcrystalline cellulose, croscarmellose sodium and the remaining lactose were added and the mixture was mixed for 2 to 10 minutes. Thereafter, magnesium stearate was added and mixing was continued for 1 to 3 minutes.

The resulting homogeneous mixture was then compressed into tablets each containing 5 mg, 10 mg, 20 or 40 mg pravastatin.

Tablets each containing the following ingredients:

	<u>Ingredient</u>	<u>Weight (mg)</u>
	(E,E)-[difluoro[hydroxy(4,8,12-trimethyl-3,7,11-tridecatrienyl)-phosphinyl]methyl]phosphonic acid	100 mg
5	tripotassium salt (squalene synthetase inhibitor prepared as described by Biller et al. supra)	
	Avicel	112.5 mg
	Lactose	113 mg
10	Cornstarch	17.5 mg
	Stearic Acid	<u>7 mg</u>
		350 mg

are prepared from sufficient bulk quantities by
15 slugging the squalene synthetase inhibitor Avicel,
and a portion of the stearic acid. The slugs are
ground and passed through a #2 screen and then
mixed with the lactose, cornstarch, and the
remainder of stearic acid. The mixture is
20 compressed into 350 mg capsule shaped tablets in a
tablet press. The tablets are scored for dividing
in half.

The pravastatin tablets and squalene
synthetase inhibitor tablets may be administered as
25 a combination in accordance with the teachings of
the present invention to lower serum cholesterol
and/or treat atherosclerosis. In addition, the
pravastatin and squalene synthetase inhibitor
tablets may be ground up into powders and used
30 together in a single capsule.

Example 2

A pravastatin formulation in the form of tablets, each containing 5 mg, 10 mg, 20 mg or 40 mg pravastatin, having the following composition was prepared as described in Example 1, except that color was incorporated into the powder mixture containing pravastatin, magnesium oxide and a fraction of the lactose.

10	<u>Ingredient</u>	<u>Parts by Weight</u>
	Pravastatin	7
	Lactose	67
	Microcrystalline cellulose	20
	Croscarmellose sodium	2
15	Magnesium stearate	1
	Magnesium oxide	3
	FD&C Red #3 Lake	0.2

The pravastatin tablet and squalene synthetase inhibitor tablet (described in Example 1) may be administered as a combination or the pravastatin tablet and squalene synthetase inhibitor tablet may be ground into powders and used in a single capsule to lower serum cholesterol and/or treat atherosclerosis in accordance with the teachings of the present invention.

Examples 3 and 4

Lovastatin tablets are prepared employing conventional pharmaceutical techniques containing 20 mg lovastatin, cellulose, color, lactose, magnesium stearate and starch and butylated

hydroxyanisole as a preservative as described in the 1988 PDR.

The lovastatin tablets may be employed in combination with the squalene synthetase inhibitor tablets (described in Examples 1 and 2) in separate or combined dosage forms to treat elevated serum cholesterol or atherosclerosis in accordance with the present invention.

10 Examples 5 to 7

A formulation in the form of tablets having the following composition is prepared as described in Example 1.

15	<u>Ingredient</u>	<u>Weight (mg)</u>
	(E,E,E)-[difluoro[hydroxy(4,8,12-trimethyl-1,3,7,11-tridecate- traenyl)phosphinyl)methyl]- phosphonic acid tripotassium salt 20 (squalene synthetase inhibitor prepared as described by Biller et al. supra)	100 mg
	Cornstarch	50 mg
	Gelatin	7.5 mg
25	Avicel (microcrystalline cellulose)	25 mg
	Magnesium stearate	<u>2.5 mg</u>
		185 mg

30 Pravastatin tablets, or lovastatin tablets described in Examples 1 and 3, respectively, or velostatin tablets may be employed in combination with the above squalene synthetase inhibitor

tablets. The pravastatin or lovastatin and
squalene synthetase inhibitor may be employed in
separate dosage forms or combined in a single
capsule form to lower elevated serum cholesterol or
5 treat atherosclerosis in accordance with the
present invention.

It will be appreciated that any of the HMG
CoA reductase inhibitors disclosed herein may be
employed in combination with any of the squalene
10 synthetase inhibitors disclosed by Biller et al.
supra and in EP-A-324421.

CLAIMS

1. A pharmaceutical combination comprising an inhibitor of the enzyme 3-hydroxy-3-methyl-glutaryl coenzyme A (HMG CoA) reductase and an inhibitor of the enzyme squalene synthetase.

2. The combination as defined in Claim 1 wherein said inhibitor of the enzyme HMG CoA reductase is mevastatin, lovastatin, pravastatin or velostatin.

3. The combination as defined in Claim 1 wherein said inhibitor of the enzyme HMG CoA reductase is a pyrazole analog of a mevalonolactone, an indene analog of mevalonolactone, a 3-carboxy-2-hydroxy-propane-phosphonic acid derivative, a 6-[2-(substituted-pyrrol-1-yl)-alkyl]pyran-2-one, an imidazole analog of mevalonolactone, or a heterocyclic analog of mevalonolactone, a naphthyl analog of mevalonolactone, an octahydro-naphthalene, fluindostatin, a keto analog of lovastatin or a 2,3-di-substituted pyrrole, furan or thiophene.

4. The combination as defined in Claim 1 wherein the inhibitor of the enzyme squalene synthetase has the formula

wherein R¹ is

5. The combination as defined in Claim 1 wherein the inhibitor of the enzyme HMG CoA reductase is present in a weight ratio to said inhibitor of the enzyme squalene synthetase of within the range of from about 0.001:1 to about 1000:1.

6. The combination as defined in Claim 4 wherein the inhibitor of the enzyme HMG CoA reductase is lovastatin, pravastatin or velostatin.

7. The combination as defined in Claim 4 wherein the inhibitor of the enzyme HMG CoA reductase is lovastatin, pravastatin or velostatin.

8. A method for lowering serum cholesterol or inhibiting formation of or treating atherosclerosis, which comprises administering to a patient in need of such treatment a therapeutically effective amount of a pharmaceutical combination comprising an inhibitor of the enzyme 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase and an inhibitor of the enzyme squalene synthetase.

9. The method as defined in Claim 8 wherein said inhibitor of enzyme HMG CoA reductase is mevastatin, lovastatin, pravastatin or velostatin.

10. The method as defined in Claim 8 wherein the inhibitor of the enzyme squalene synthetase has the formula

wherein R¹ is

11. The method as defined in Claim 10 wherein the inhibitor of the enzyme HMG CoA reductase is lovastatin, pravastatin or velostatin.

12. A hypocholesterolemic or hypolipemic composition comprising a combination as defined in Claim 1 and a pharmaceutically acceptable carrier therefor.
